# Analysis

## Presentations:

- Presentation to cross section meeting

## KKpi analysis:

- Work in progress
  - Had to fix energy cut

## $\Xi^*$ analysis:

- Requested studies:
  - Vertex dependence on  $\pi^0$  mass with real and MC data (status: started MC)
  - $t$ -cut dependence on  $\Xi^*$  spectrum (status: in progress)
  - Vertex angle between momentum and path of  $\Xi$  (status: not started)
  - Refine MC generator distributions (status: Initial run with  $s$  and  $t$  distributions are complete)
  - Mass fit  $\Xi$  for each bin in  $\Xi^*$  (status: complete)

# $\mathcal{E}^*$ Generator Refinement

- Starting with code from Brandon build for  $\mathcal{E}(1530)$  and modifying for general  $\mathcal{E}^*$

# $\Xi^*$ Generator Refinement

- Starting with code from Brandon build for  $\Xi(1530)$  and modifying for general  $\Xi^*$
- Taking the initial reaction as  $\gamma p \rightarrow K Y^*$

# $\Xi^*$ Generator Refinement

- Starting with code from Brandon build for  $\Xi(1530)$  and modifying for general  $\Xi^*$
- Taking the initial reaction as  $\gamma p \rightarrow K Y^*$
- Mandelstam variables have relationship:
  - $s+t+u = m_\gamma^2 + m_p^2 + m_K^2 + m_{Y^*}^2$

# $E^*$ Generator Refinement

- Starting with code from Brandon build for  $E(1530)$  and modifying for general  $E^*$
- Taking the initial reaction as  $\gamma p \rightarrow K Y^*$
- Mandelstam variables have relationship:
  - $s+t+u = m_\gamma^2 + m_p^2 + m_K^2 + m_{Y^*}^2$
- We can lock down the kinematics of the initial reaction by specifying  $s$ ,  $t$  and  $m_{Y^*}$

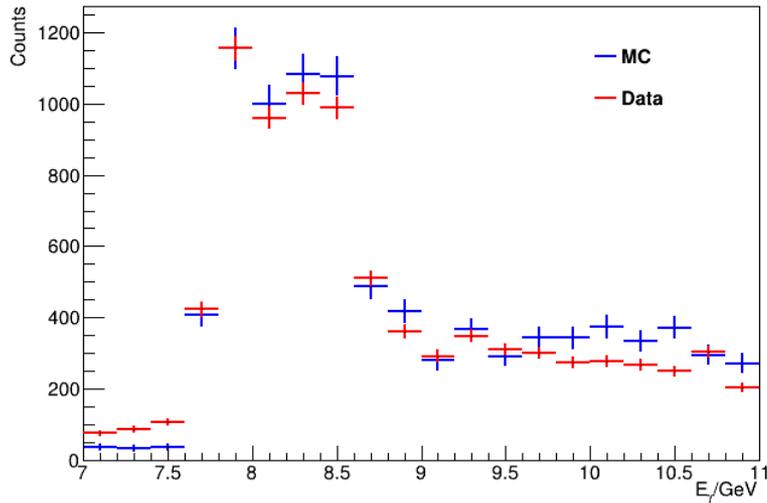

# $E^*$ Generator Refinement

- Starting with code from Brandon build for  $E(1530)$  and modifying for general  $E^*$
- Taking the initial reaction as  $\gamma p \rightarrow K Y^*$
- Mandelstam variables have relationship:
  - $s+t+u = m_\gamma^2 + m_p^2 + m_K^2 + m_{Y^*}^2$
- We can lock down the kinematics of the initial reaction by specifying  $s$ ,  $t$  and  $m_{Y^*}$
- Started with Mandelstam  $s$  and  $t$

# $E^*$ Generator Refinement

- Starting with code from Brandon build for  $E(1530)$  and modifying for general  $E^*$
- Taking the initial reaction as  $\gamma p \rightarrow K Y^*$
- Mandelstam variables have relationship:
  - $s+t+u = m_Y^2 + m_p^2 + m_K^2 + m_{Y^*}^2$
- We can lock down the kinematics of the initial reaction by specifying  $s$ ,  $t$  and  $m_{Y^*}$
- Started with Mandelstam  $s$  and  $t$
- Will move to  $m_{Y^*}$  refinement next time

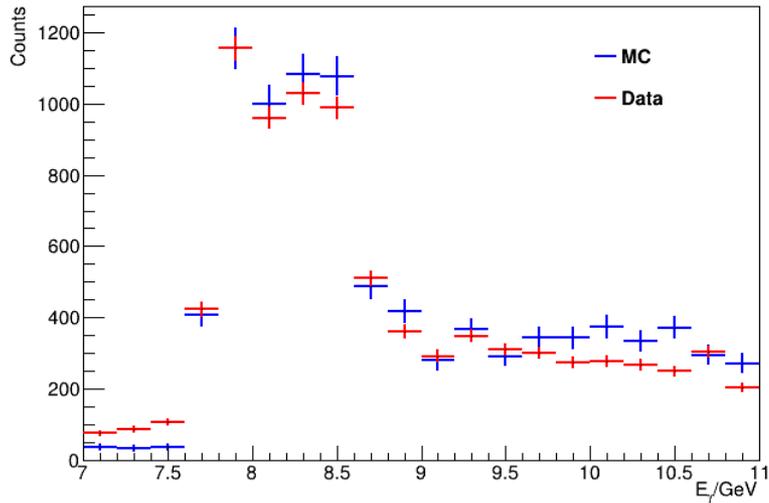

# $E^*$ Generator Refinement

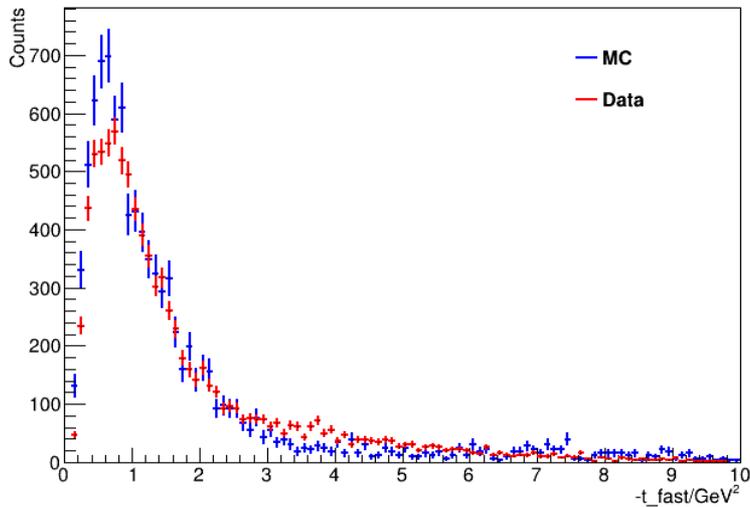

Note:  $s = 2E_\gamma m_p + m_p^2$

- Looks OK, but can probably be refined more

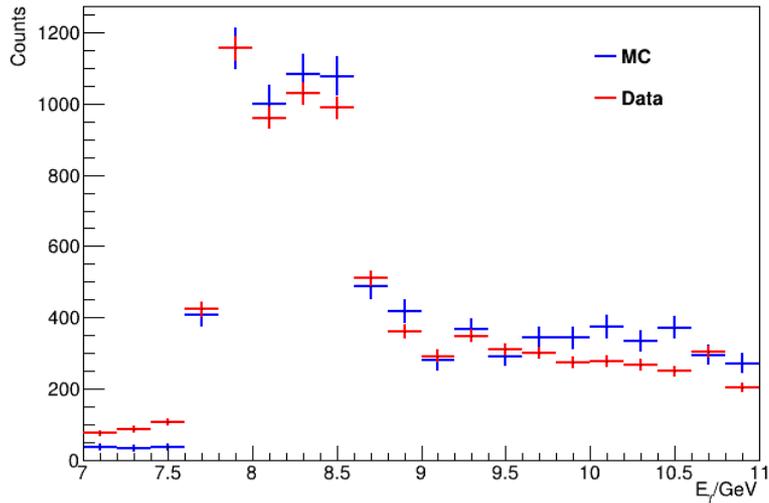

# $E^*$ Generator Refinement

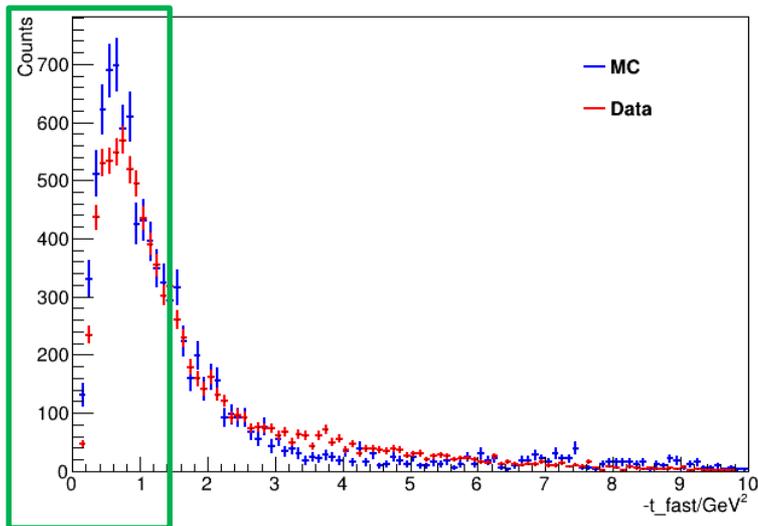

- $-t$  (fast) looks good, except between 0.4 and 0.7

# $E^*$ Generator Refinement

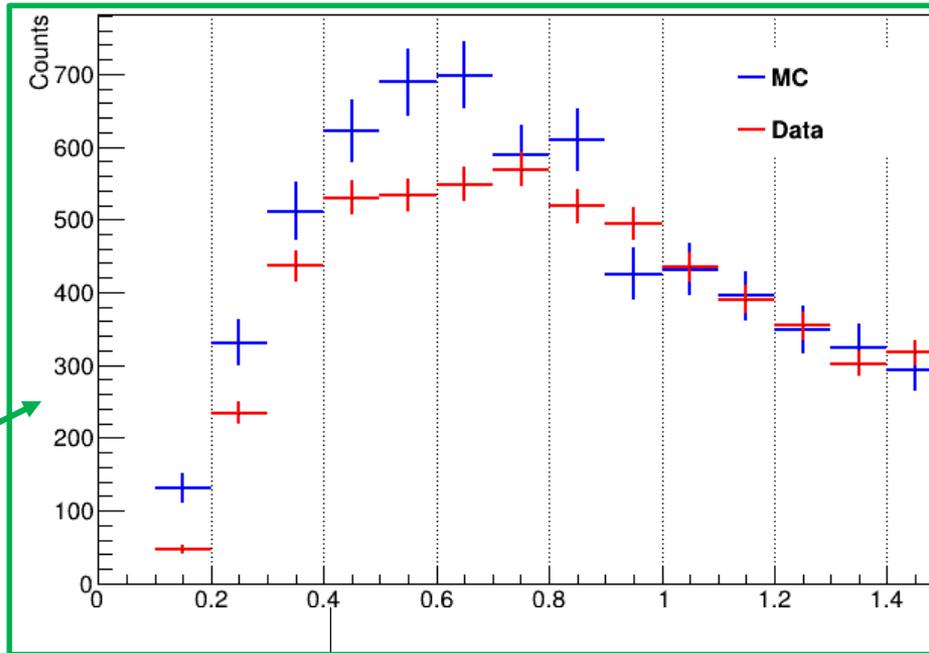

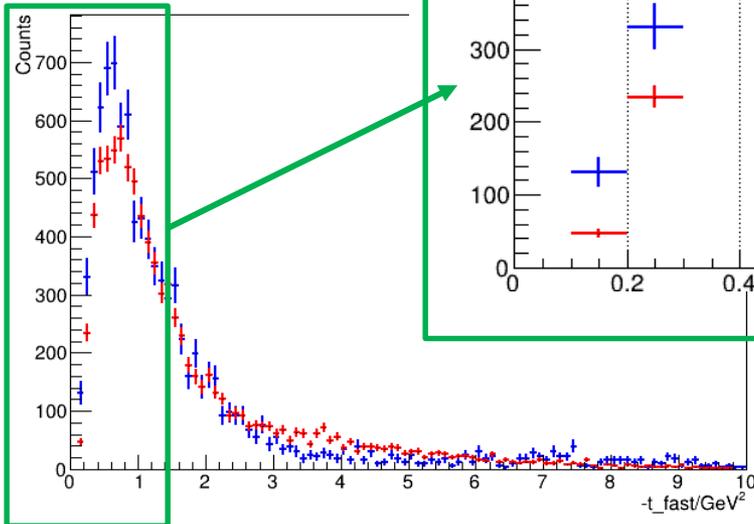

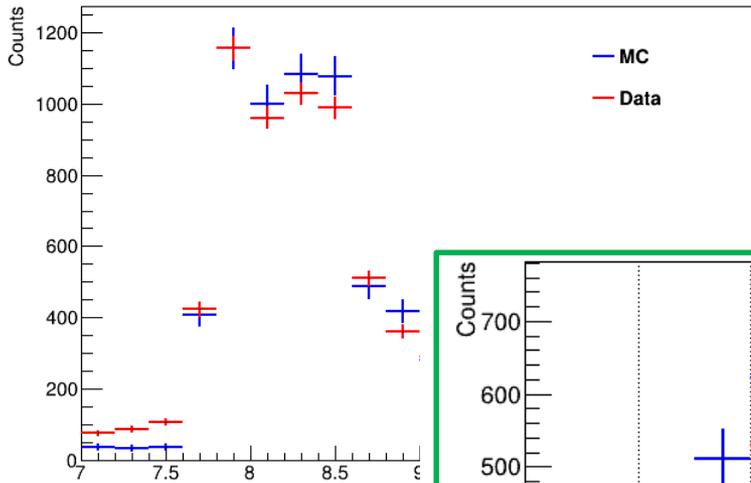

- $-t$  (fast) looks good, except between 0.4 and 0.7

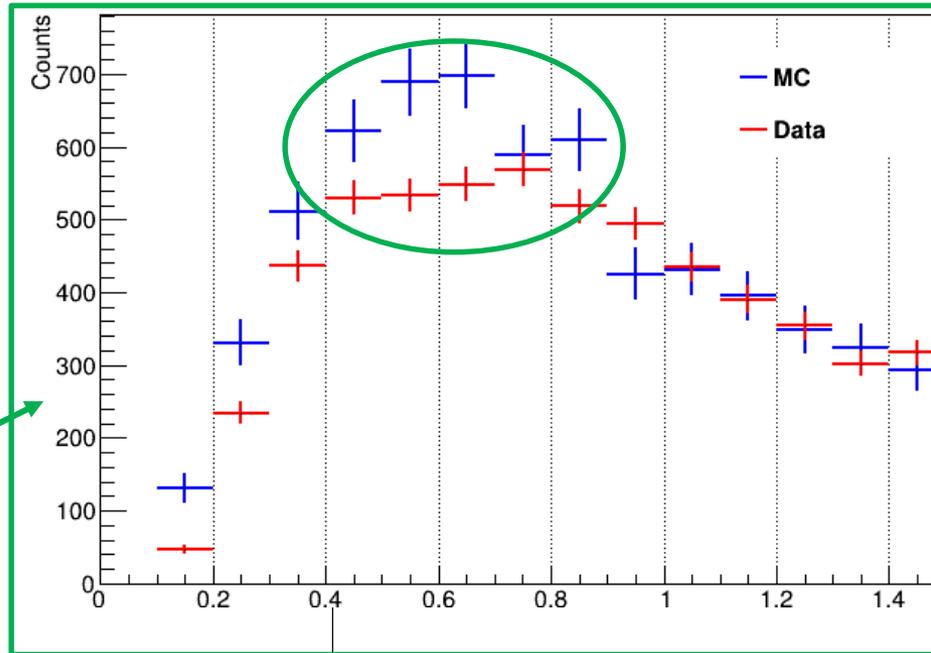

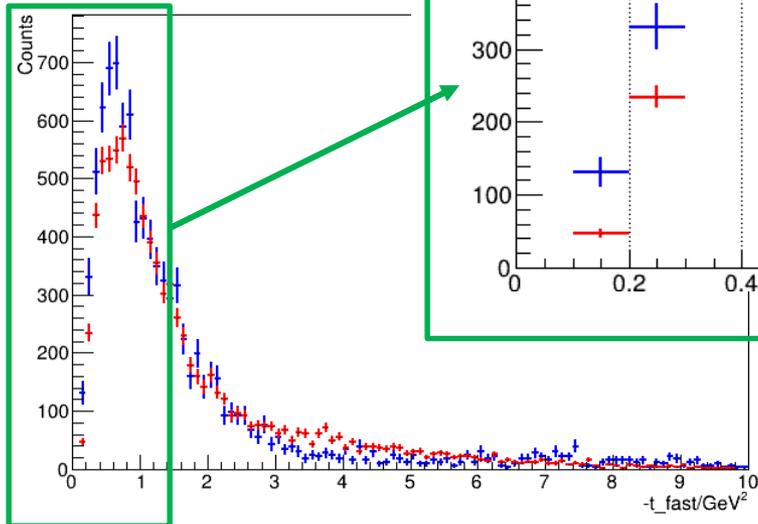

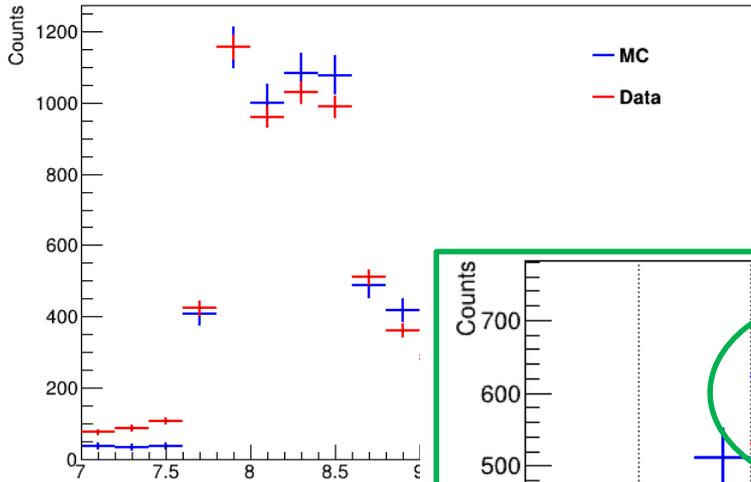

# $E^*$ Generator Refinement

- $-t$  (fast) looks good, except between 0.4 and 0.7

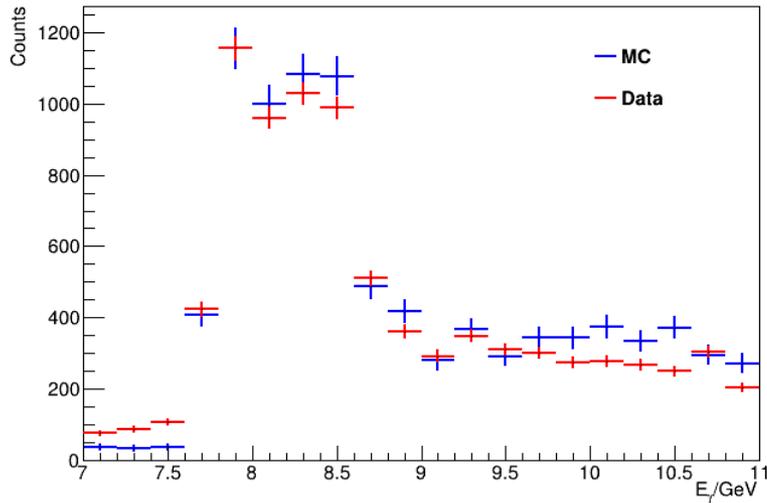

# $E^*$ Generator Refinement

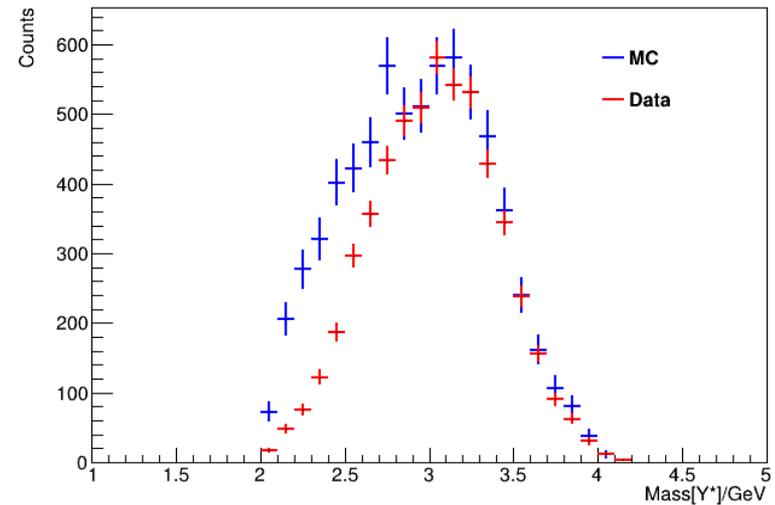

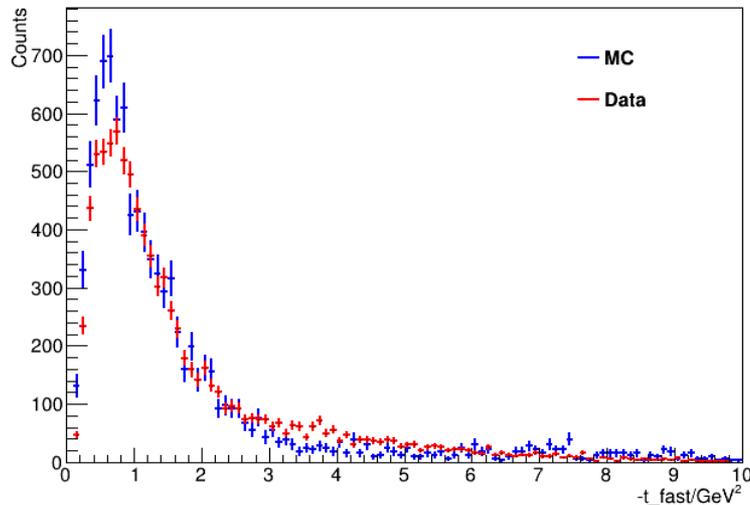

- $-t$  (fast) looks good, except between 0.4 and 0.7

# $E^*$ Generator Refinement

Not yet tried to get the  $Y^*$  shape to match and the high mass part of distribution already looks good 😊

# Data and cuts

Dataset:

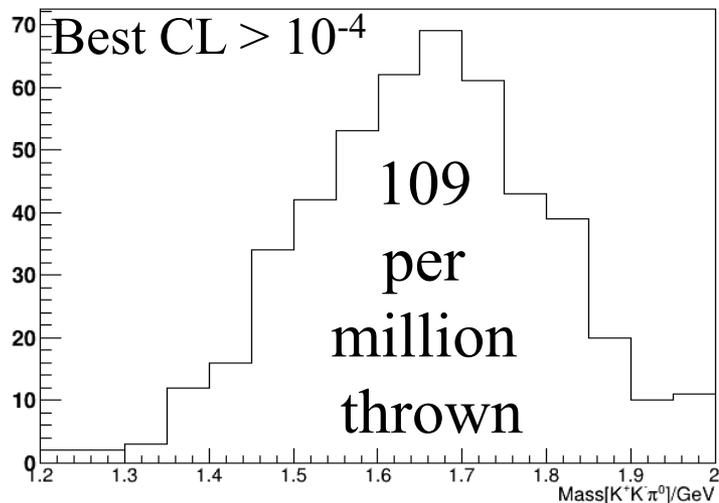

- Spring 2018 data

Restrictions:

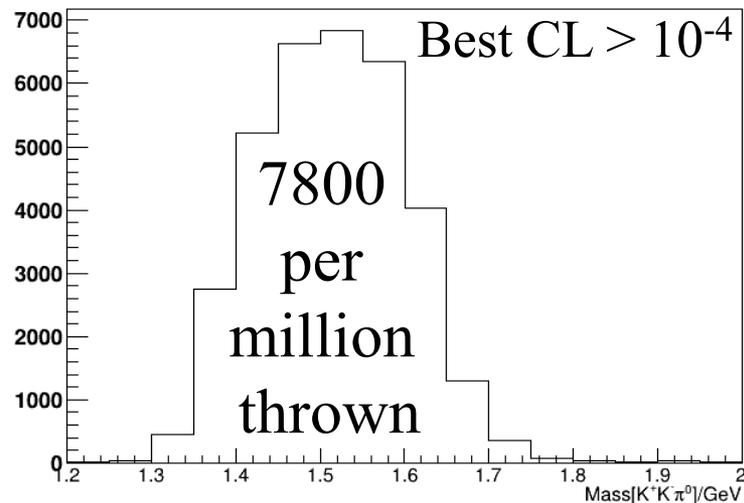

- Incident photon timed to be within central peak
- Only best Confidence Level ( $CL$ ) per event kept
- $CL$  must be above  $10^{-4}$
- Kaons must be forward directed (seen in TOF)
- Kaons must have momentum  $< 3$  GeV
- Missing mass within 3 standard deviations of central peak
- $0.12 \text{ GeV} < \text{Mass}[\pi^0] < 0.15 \text{ GeV}$

# Contamination study (4.4 million thrown)

- The  $\Xi(1620)$  that will be shown might be real (but might not ☹)
- The  $\Xi(1690)$  that will be shown all have zero width and are probably a statistical fluctuation. The line shapes (**cyan**) will be entirely due to the resolution of the reconstructed mass( $\Xi\text{-}\pi^0$ )

OMITTED FROM SUMMARY TABLE

The clearest evidence is a peak in  $\Xi^- \pi^+$  seen by SUMIHAMA 19.  
 Older low-statistics experiments (e.g., BORENSTEIN 72 and HAS-SALL 81) have looked for the state but have not seen any effect.
